# **Practice Problems List-10 (Functions)**

1. Create a function for printing Hello World.

2. Create a function for adding two integers and printing the result within the function.

3. Create a function to find the sum of three integers and return the sum.

4. Create a function that takes three integers as arguments and returns the average of them.

5. Create a function to check if a number is divisible by 5 and 6, or not. The function should return a boolean value (true/false).

6. Create a function to check if an English letter is uppercase or lowercase. The function should return a boolean value. (true/false)

7. Create a function to find the minimum of three integers. The function should return the value.

8. Create a function to check whether a triangle is valid from the lengths of its sides. The function should return a boolean value (true/false). (sum of every two sides is greater than the third)

9. Create a function to check whether a triangle is valid or not from the lengths of its angles. The function should return a boolean value (true/false). (sum of all three angles should be 180 degrees)

10. Create a function to check whether a character is an alphabet, digit, or special character. You can print "alphabet", "digit", or "special character" inside the function.

11. Create a function to find the quadrant of an (x,y) point. If the point falls upon an axis or the origin, print so.

12. Create a function that returns the cube of an integer.

13. Create a function to calculate the circumference of a circle. ($2\pi r$)

14. Create a function for converting a celsius temperature to fahrenheit. The function should return the value in fahrenheit.

15. Create a function to check whether a year is a leap year or not. The function should return a boolean value. (true/false)

16. Create a function to find the level of heat from the temperature.
    (If the temperature is 40 degrees or more, it is “super hot”. If it is 30 degrees or more, the temperature is “hot”. Otherwise it’s “cold”.)
