

Practice Problems List-1

1. Print the following using printf:

Hello World

I am learning C programming.

2. Print the following using printf: **"Hi"**
[you must print *Hi* within quotation, that is, the quotation marks must be shown in the output]
3. Print the following using printf: **I will give my 100% in this course**
4. Print the following pattern:

```
*
* *
* * *
* * * *
* * * * *
* * * * *
```

5. Declare two integer variables, initialize them (assign values), and print their sum.
6. Declare two integer variables, initialize them (assign values), and print their average in the following format: **The average of 6 and 8 is 7**
(Let your input numbers be 6 and 8, for example)
7. Declare three integer variables, initialize them (assign values), and print their product (multiply the three variables).
8. Take two integers as input (use **scanf**) and execute addition, subtraction, and multiplication operations between them. Output the result in each case in the following format:
6 + 8 = 14
6 - 8 = -2
6 x 8 = 48

9. Take two numbers a and b as inputs, and output the result of a/b . Try for different inputs and see if you can understand how division operation works for integers.
10. Take two numbers a and b as inputs, and output the remainder if a is divided by b .
11. Take three integers a , b , and c as input, and output the result of the following expression: $b^2 - 4ac$.
12. Take two **integers** a and b as inputs, and output the result of a/b . Make sure it displays proper output in decimal accurately up to two decimal points.
13. Take input a measurement in meters and convert it to centimeters.
14. Take an integer as input (use `scanf()`) and print the last digit of the integer.
15. Take two integers a and b as input, and swap their values.
[Swapping means the value of a should go to b , and the value of b should go to a]
