

Intent of the Design Patterns

Singleton: Ensure a class only has one instance, and provide a global point of access to it.

Strategy: Strategy design pattern lets you define a family of algorithms, put each of them into a separate class, and make their objects interchangeable.

Facade: Facade is a design pattern that provides a simplified interface to a set of interfaces in a subsystem. Facade defines a higher-level interface that makes the subsystem easier to use.

Memento: Memento lets you save and restore the previous state of an object without revealing the details of its implementation.

Factory: Define an interface for creating an object, but let subclasses decide which class to instantiate. Factory Method lets a class defer instantiation to subclasses.
